Product Specification

+/-800 ps/nm (40km) Tunable XFP Optical Transceiver

FTLX6611MCC-xx and FTLX6614MCC-xx

PRODUCT FEATURES

• Supports 8.5Gb/s to 11.35Gb/s
• -800 to +800 ps/nm Dispersion Tolerance
• Supports 50GHz ITU-based channel spacing (C-Band) with a wavelength locker
• Monolithic MZM Tunable TOSA
• Temperature range: -5°C to 70°C
• RoHS-6 Compliant (lead-free)
• Power dissipation <3.5W
• Built-in digital diagnostic functions
• High performance PIN Receiver
• Adjustable receiver threshold with option for automatic optimization through FEC feedback

APPLICATIONS

• DWDM 10Gb/s SONET/SDH
• DWDM 10Gb/s Ethernet & 10Gb/s Fibre Channel
• DWDM 10Gb/s SONET/SDH w/FEC
• DWDM 10Gb/s Ethernet and 10Gb/s Fibre Channel w/FEC

Finisar’s FTLX6611MCC-xx Small Form Factor 10Gb/s (XFP) transceiver complies with the XFP Multi-Source Agreement (MSA) Specification¹. It supports amplified DWDM 10Gb/s SONET/SDH, 10 Gigabit Ethernet, and 10 Gigabit Fibre Channel applications over 40km of fiber without dispersion compensation. Digital diagnostics functions are available via a 2-wire serial interface, as specified in the XFP MSA. The optical transceiver is compliant per the RoHS Directive 2011/65/EU³. See Finisar Application Note AN-2038 for more details⁴.

</table>

Notes:
1. Module circuit ground is isolated from module chassis ground within the module.
2. Open collector; should be pulled up with 4.7k – 10kohms on host board to a voltage between 3.15V and 3.6V.
3. Reference clock is single ended and requires a non-inverted input on PIN 24. Finisar recommends also using the inverted input on PIN 25 for noise considerations. Version not requiring Host board Reference Clock is also available upon request.

**Notes:**
1. Maximum total power value is specified across the full temperature and voltage range.
2. After internal AC coupling.
3. Or open circuit.
4. Into 100 ohms differential termination.
5. 20 – 80 %
6. Loss Of Signal is open collector to be pulled up with a 4.7k – 10kohm resistor to 3.15 – 3.6V. Logic 0 indicates normal operation; logic 1 indicates no signal detected.
7. Per Section 2.7.1. in the XFP MSA Specification’.

Notes:
1. Corresponds to approximately 0.4 nm.
2. $\lambda_c =$ Specified ITU Grid wavelength. Wavelength stability is achieved within 30 seconds of power up.
3. Measured with a host jitter of 50 mUI peak-to-peak.
4. Measured with a host jitter of 7 mUI RMS.
5. Measured at 1528-1600nm with worst ER; PRBS31.
6. All OSNR measurements are performed with 0.1nm resolution.

VI. Environmental Specifications

Finisar FTLX6611MCC and FTLX6614MCC XFP transceivers have an operating temperature range from -5°C to +70°C case temperature.

<table>

</tr>
</tbody>
</table>

Copies of the referenced certificates are available at Finisar Corporation upon request.
VIII. Digital Diagnostics Functions

As defined by the XFP MSA, Finisar XFP transceivers provide digital diagnostic functions via a 2-wire serial interface, which allows real-time access to the following operating parameters:

- Transceiver temperature
- Laser bias current
- Transmitted optical power
- Received optical power
- Transceiver supply voltage
- TEC Temperature

It also provides a sophisticated system of alarm and warning flags, which may be used to alert end-users when particular operating parameters are outside of a factory-set normal range.

The operating and diagnostics information is monitored and reported by a Digital Diagnostics Transceiver Controller (DDTC) inside the transceiver, which is accessed through the 2-wire serial interface. When the serial protocol is activated, the serial clock signal (SCL pin) is generated by the host. The positive edge clocks data into the XFP transceiver into those segments of its memory map that are not write-protected. The negative edge clocks data from the XFP transceiver. The serial data signal (SDA pin) is bi-directional for serial data transfer. The host uses SDA in conjunction with SCL to mark the start and end of serial protocol activation. The memories are organized as a series of 8-bit data words that can be addressed individually or sequentially. The 2-wire serial interface provides sequential or random access to the 8 bit parameters, addressed from 000h to the maximum address of the memory.

For more detailed information, including memory map definitions, please see the XFP MSA documentation.

Receiver Threshold Adjustment

The FTLX6611MCC and FTLX6614MCC also provide access to receiver decision threshold adjustment via 2-wire serial interface, in order to improve receiver OSNR performance based on specific link conditions. It is implemented as follows:

- Rx Threshold of XFP transceivers will be factory-set for optimized performance in non-FEC applications. This will be the default value during both cold start (power-up) and warm start (module reset).
- The transceiver supports adjustment of Rx Threshold value by the host through register 76d, table 01h. This is intended to be used in FEC applications.
- Register 76d, table 01h is a volatile memory. Therefore if the transceiver is power-cycled, the register starts up with a value of 00h which corresponds to the default Rx Threshold value.
- The threshold adjustment input value is 2’s complement 7 bit value (-128 to +127), with 0 corresponding to default Rx threshold value. Full range of adjustment provides at least a ±10% change in Rx threshold from the default value.
- An increase in RxDTV value sets the threshold closer to the “1” value of the eye. The Default setting is the factory tuned optimized set point and is not necessarily the 50% RxDTV value.

### SBS suppression, dither tone

Set Address 111, bit 1 to “0” to enable tone, “1” to disable dither tone (defaults: frequency = 40kHz, tone is disabled). Please contact your Finisar RSM or PLM if specific amplitudes and frequencies are needed for SBS suppression.

### Tuning Management Interface for ITU Frequency Grid Applications

Implementation of wavelength or frequency tunability is indicated in Serial ID Byte 221 (Table 01h) bit 1.

<table>
<thead>
<tr>
<th>Data Address</th>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>221 (Table 01h)</td>
<td>1</td>
<td>Wavelength or frequency tunability implemented</td>
</tr>
</tbody>
</table>

The Finisar tunable XFP supports both wavelength and frequency tuning (as specified in INF-8077i), the wavelength tuning support is indicated by the transceiver description encoded in Serial ID Byte 138 bits 2 and 3.

<table>
<thead>
<tr>
<th>Address</th>
<th>Bit</th>
<th>Description of transceiver</th>
</tr>
</thead>
<tbody>
<tr>
<td>138</td>
<td>3</td>
<td>Tunable DWDM (selection by channel number, bytes 112-113)</td>
</tr>
<tr>
<td>138</td>
<td>2</td>
<td>Tunable DWDM (selection in 50 pm steps, bytes 72-73)</td>
</tr>
</tbody>
</table>
Upon a power up, the module will go to a default wavelength (Finisar default channel is 1549.716nm) or the last channel set by the host. If Tx_DIS is asserted upon power up, the laser will be disabled and the set wavelength will be cleared. Once the Tx_DIS is de-asserted, the firmware will maintain the laser in an off state until the host sets the desired ITU channel. If the module is powered-down before the ITU channel was set and TX_DIS de-asserted, the module will re-start at the default channel. See the following startup channel flowchart.

Flow Chart of Startup Channel

A desired wavelength can be commanded by the user by writing into Bytes 72 (MSB) and 73 (LSB). Wavelength control command:

<table>
<thead>
<tr>
<th>Address</th>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>72 (MSB) &amp; 73</td>
<td>All</td>
<td>Wavelength Set</td>
<td>User input of Wavelength set point (in units of 50 pm)</td>
</tr>
<tr>
<td>74 (MSB) &amp; 75</td>
<td>All</td>
<td>Wavelength Error</td>
<td>Monitor of Current Wavelength Error (in units of 5 pm)</td>
</tr>
</tbody>
</table>

Thus for instance a target wavelength of 1556.55 nm would correspond to 79h (MSB) written to Byte address 72 and 9Bh (LSB) written to Byte address 73. Alternatively a desired frequency channel can be commanded by the user by writing into Bytes 112 (MSB) and 113 (LSB).
The channel number is derived from the following equation using parameters found in Module capabilities as listed in Byte Addresses 60-69:

\[ \text{Channel number} = 1 + \frac{(\text{Desired Frequency} - \text{First Frequency})}{\text{Grid Spacing}} \]

### Alarm and Warning Threshold Values

</table>
IX. Mechanical Specifications

Finisar’s XFP transceivers are compliant with the dimensions defined by the XFP Multi-Sourcing Agreement (MSA).

**XFP Transceiver (dimensions are in mm)**
X. PCB Layout and Bezel Recommendations

XFP Host Board Mechanical Layout (dimensions are in mm)
XFP Detail Host Board Mechanical Layout (dimensions are in mm)

XFP Recommended Bezel Design (dimensions are in mm)
XI. Notes & Exceptions

- XFI loopback operation:
  - When XFI Loopback is enabled, the Transmitter output is disabled.
  - When Line Loopback is enabled, the CDR output is disabled.

- 8.5Gb/s operation requires configuration change via I2C vendor reserved command.

XII. References

4. “Application Note AN-2038: Finisar Implementation of RoHS Compliant Transceivers”.

XIII. Product Selection Details

FTLX6611MCC-xx/ FTLX6614MCC-xx

FT: FT Series
L: RoHS-6
X: 10G Bit Rate Class
66: 40km (symmetric chirp) widely tunable with PIN Receiver
1: XFP form factor
1: Gen 1 (Standard Performance), 4: Gen 1 (High-Performance)
M: Multiprotocol, 8.5Gb/s supported with I2C command
C: Commercial temperature range
C: ITU-T C-Band 50GHz spacing
xx: customer specific (not required for standard configuration)
XIV. Revision History

<table>
<thead>
<tr>
<th>Revision</th>
<th>Date</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A00</td>
<td>1/21/2011</td>
<td>Initial Release</td>
</tr>
<tr>
<td>A01</td>
<td>7/21/2011</td>
<td>Updates as follows: new T-XFP photo on front page (green bail latch); clarify reference clock single ended specs; improve min. SBS to +16dBm; update initialization time to MSA requirement of 300ms max; clarify RxDTV slope direction; correct Set Dither Address to Byte 111, bit 1 and default frequency to 40kHz and “0” to enable; clarify default and startup channel behavior (add flowchart); correct Byte 138 to call out bits 2&amp;3 for WL tuning support (mistake in INF-8077i); clarify addresses 96-97 for module case temp; new mechanical picture with standard label; removed exception to MSA initialization time; clarified XFI and Line Loopback details.</td>
</tr>
<tr>
<td>A02</td>
<td>8/10/2012</td>
<td>Update Rx_LOS min assert value to -26dBm</td>
</tr>
<tr>
<td>B1</td>
<td>8/20/2015</td>
<td>Updated logo and RoHS statement</td>
</tr>
</tbody>
</table>
